

Pr : Preamble

BSS Primary Channel

Store the retry count, the contention window, and the backoff counter

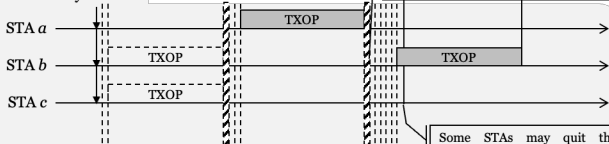

Transmission probability decreases multiplicatively when STA detects collided transmission

Resume the contention with the stored variables

The STAs except transmitting one set their transmission probability equal to the corresponding STA's value

NPCA Primary Channel

slot
time

Transmission probability grows multiplicatively when the STA senses that the channel is idle

Some STAs may quit the contention when the remained contention opportunity is shorter than candidate TXOP
